DETAILED ACTION

Allowable Subject Matter

The indicated allowability of claim 6 is withdrawn in view of Richardson et al. (US Pat. 5,454,823).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 6 is rejected under 35 U.S.C. 102(b) as being anticipated by Richardson et al. (US Pat. 5,454,823).

Richardson et al. disclose a method of suturing a portion of biological tissue (abstract) using a suturing device (Fig. 1, ref. 1) having a longitudinal axis (Fig. 1), a needle (Fig. 2, ref. 13) attached to a suture (Fig. 5, ref. 16), a needle driver (Fig. 3, ref. 5), and at least one needle holder (Fig. 3, ref. 4), the method comprising: (a) positioning a distal needle holder in a distal position relative to the portion of biological tissue (Fig. 5), the distal needle holder adapted to releasably hold the needle (Fig. 4)(Fig. 5), and positioning a distal end of the needle driver in a proximal position relative to the portion of biological tissue (Fig. 4); (b) positioning the needle in either the proximal position or the distal position (Fig. 4); (c) moving the needle driver longitudinally in a first direction along a path substantially parallel to the longitudinal axis such that the needle and suture pass through the portion of biological tissue (Fig. 4)(Fig. 5), thereby forming a

suture incision through which the suture passes (Fig. 5); and (d) repeating (a) - (c) to form a series of stitches (column 4, lines 59-63); wherein the needle is positioned in a proximal position relative to the portion of biological tissue by releasably holding the needle in a proximal needle holder positioned in a proximal position relative to the portion of biological tissue (Fig. 3); and wherein the needle is positioned in the proximal position relative to the portion of biological tissue by releasably holding the needle with the distal needle holder positioned in the distal position relative to the portion of biological tissue and translating the distal needle holder to the proximal position (Fig. 5)(Fig. 6).
